Abstract: High purity nano HNS was prepared by the combination of solution quench recrystallization and solvent-antisolvent recrystallization. Results show that crystal appearance of nano HNS is smoother with particle size from 58.9 nm to 231.6 nm, and its purity is increased from 90.1% to 99.44%, the BET specific surface area is determined to be $19.27 \text{ m}^2 \cdot \text{g}^{-1}$. Sensitivity tests for the raw HNS and nano HNS indicate that nano HNS is less sensitive to impact than raw HNS, but more sensitive to short impulse shock waves.

Key words: organic chemistry; nano explosive; 2,2',4,4',6,6'-hexanitro-stilbene (HNS); high purity; solvent-antisolvent recrystallization
